

# 15663 Assignment 6

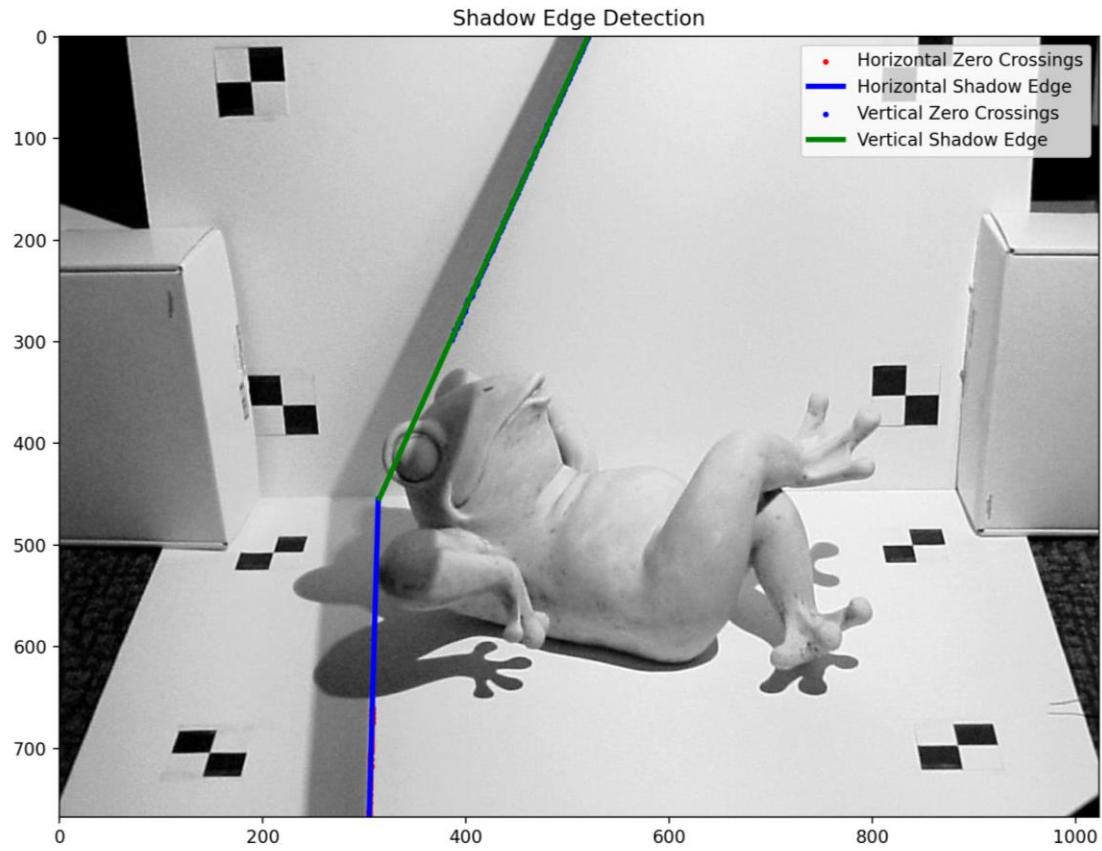

## 1. Implementing Structured Light Triangulation:

### Shadow Edge Estimation:

Frame 100:

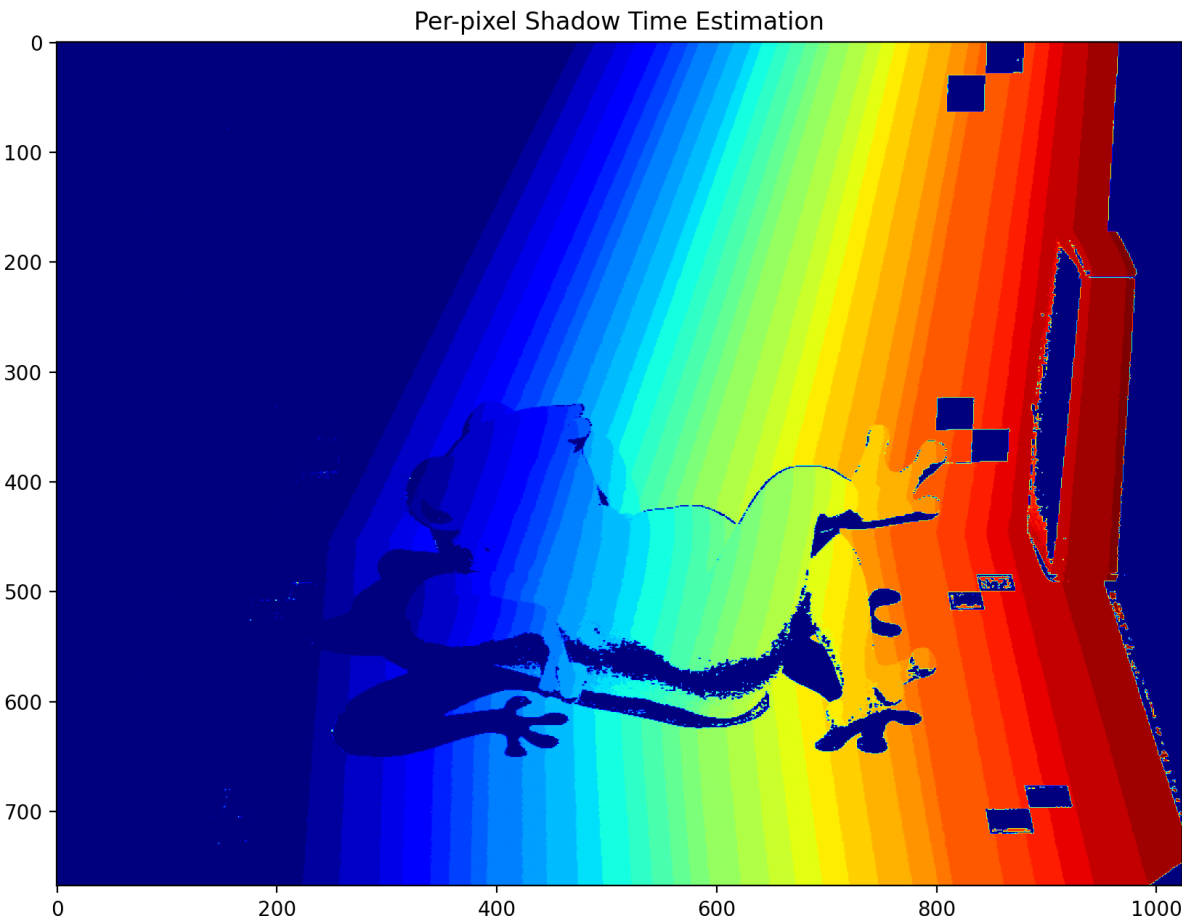

## Frame 10:

## Frame 45:

**Per-pixel Shadow Time Estimation:**

### 3D Shadow Points Visualization over time:

## 3D Reconstruction of Frog:

## 2. Building own 3D scanner :

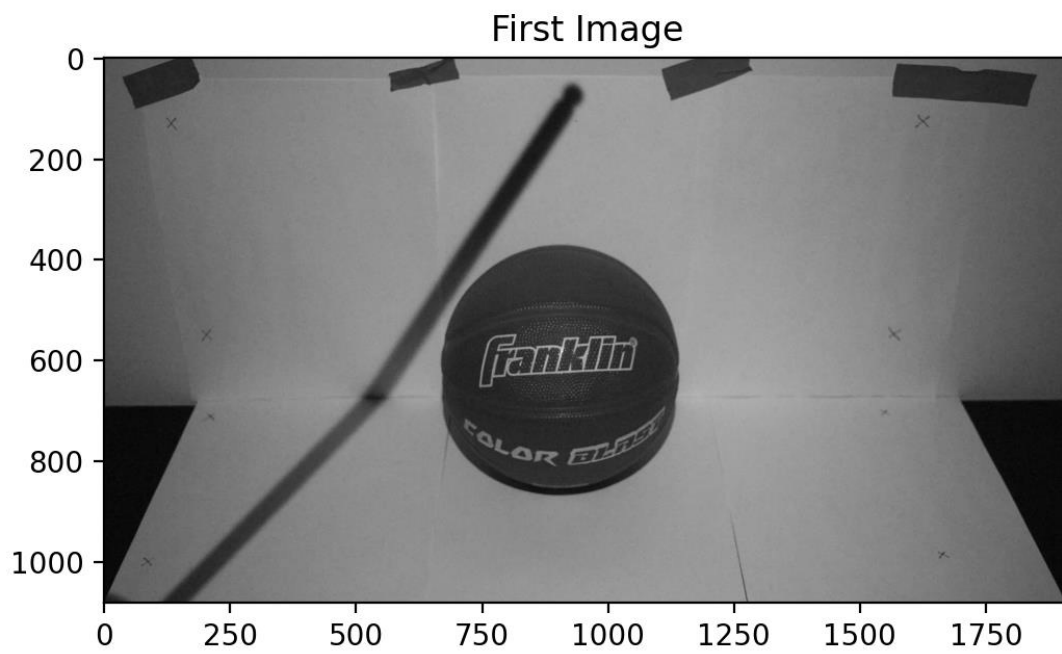

## Setup:

**Camera Calibration:**

**3D Point Visualization:**

### 3D Reconstruction:

As you can see, the reconstruction failed in this case. I have verified all the steps until the intrinsic calibration. I suspect the issue to be either extrinsic calibration or the shadow plane construction.

### 4. Direct-Indirect Separation :

Image 1 :

**Image without shadows:**

**Image with stick shadow:**

## Global Illumination

Direct Illumination

**Image 2:**

**Image without shadows:**

**Image with stick shadow:**

Direct Illumination

Global Illumination

The edges of the ball reflects more light in case of global illumination due to interreflections

**Image 3:**

**Image without shadows:**

**Image with shadow stick:**

Direct Illumination

Global Illumination

If we observe the washing liquid bottle and the transparent cover, in direct case, they are mostly dark because most of the light undergoes subsurface scattering. But in case of global illumination, sub surface scattering helps in visualizing the inner properties more clearly even compared to the actual captured image. This is especially evident when we observe the text on the ball inside the cover, which is easily readable from the global illumination image.
